

Recent science and government studies have highlighted the effects that carbon emissions and global warming are having on the environment. In our ever-changing world, products and services are constantly in demand, and making sure they are delivered safely and on time, is our business. As we learn and understand more about the impact we, as individuals and as businesses have on the environment, we must change and adapt our practices in line with current thinking and legislation.

- **We are committed to continuously improving our practices in order to minimise the impact of our freight movement on the environment**
- **We monitor progress, review our environmental performance and update our Environmental Policy on a regular basis**
- **We comply with all relevant legislation as a bare minimum level of performance**
- **We keep to a minimum, the mileage travelled by our vehicles, thus reducing diesel consumption and unnecessary emissions**
- **We minimise our noise pollution both locally and nationally by choosing the most suitable routes for vehicles to travel**
- **We educate staff about the effects their jobs have on the environment, and train them in ways to minimise the impact of what they do**
- **We recycle all packaging materials used within the operation of the Company**
- **We use both water and energy efficiently, minimising waste and turning off unnecessary lighting and electrical appliances**
- **We minimise our usage of non-organic chemical cleaning products**
- **We are always happy to listen to and liaise with local or national parties who have an interest in our operations and their impact on the environment**
